                                                                                                                                               Direct Submission
Submitted (26-SEP-1998) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.

Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence similarities were identified using Powerblast by Jinghui Zhang.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /clone_loss_2.2.0./

The present sequence represents RHK1 used from an example of the present invention which describes a Hansenula mrakil protease resistant killer protein. The killer protein has antibacterial activity and so can be used in an antibacterial agent which contains the killer protein as the active component. The killer protein can also be used as the active component in an antibacterial soop. The protein, which was derived from the yeast Hansenula mrakil, has antibacterial properties and may be used in sterilising and cleaning compositions e.g. soap. recombinantly in a large amount.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        112 MMIHGY-----ESWALHCHCSSPGSLQCIAGGQ-----VLASWFRWVVDGAMFNQRF 158

The oligonucleotides given in 039617-18 are selectively hybridisable to the BHREI gene (039619). The antisense oligonucleotides can be used to treat EBV infection in patients suffering from infectious mononucleosis, Hodgkin's disease, Burkitt's lymphoma, undifferentiated nasopharyngeal carcinoma, AIDS related lymphoma or angioinmunoblastic lymphadenopathy. They can also be used to treat EBV-induced proliferative diseases by treating bone marrow from a patient to destroy proliferating tumour cells, then reimplanting the

Human HER-2/neu protein (W01111), also called p185 or c-erbb2, is the product of the HER-2/neo oncogene (see also #40739). The protein is over-expressed in various cancers, including breast, ovarian, colon, lung and prostate. The intracellular domain of the protein can be used to immunise an animal against a malignancy with which the oncogene is associated. The polypeptide can be produced in transformed host cells for use in immunisation. Alternatively, that directs expression of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     գ

The DNA fragment was isolated from HVT strain FC126 (J. Gen. Virol., 70:1789-1804 (1989)) and is used as a basis for generating live recombinant viral vaccines using the herpes virus DNA sequences as vectors. The fragment contains 3 intergent regions into which genes encoding heterologous proteins to be expressed can be inserted, preferably under control of the cytomegalovirus immediate early (CMV-IE) promoter. The heterologous proteins can be used to vaccinate
response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence. CC This Saccharomyces polypeptide comprises a cytosolic

CY 12 propertion of dlydroxyacetone phosphate to glycerol-3-phosphate.

CC Glycerol-3-phosphate (G3P) (see also cytoss 31pp) and a variety of cytoss 31pp and/or glycerol-1-phosphatese (G3P) (see also cytoss 31pp) and/or glycerol-1-phosphatese (G3P) (see also containing either a G3PpH gene and/or a G3P gene and then cultured containing either a G3PpH gene and/or a G3P gene and then cultured containing either a G3PpH gene and/or a G3P gene and then cultured containing either a G3PpH gene and/or a G3P gene and then cultured containing either a G3PpH gene and/or a G3P gene and then cultured containing eithe a monor, oligo., polysaccharde or 10-substrate.

CT be glycerol obtained is used in cosmetics, liquid soaps, the oil and fat industries. The method produces glycerol rapidly sequence 391 AA;

Sequence 391 AA;

New method for increasing production of 1,3-propane:diol - comprises

Termentation of inexpensive carbon sources by microorganism
expressing dehydratase, used, e.g. to prolong half-life of enzyme
expressing dehydratases, used, e.g. to prolong half-life of enzyme
bisclosure; Page 65-66; 133pp; English.

The sequence is that of cytosolic glycerol-3-phosphate dehydrogenase.

The sequence is that of cytosolic glycerol-3-phosphate dehydrogenase.

I has used as part of a method of fermentative production
of 1,3-propanediol (1,3-pd), using an organism comprising
at least 1 gene encoding a dehydratase, is improved by
inserting into the host a gene encoding protein x and culturing
the transformant in presence of a carbon source (e.g. mono-, oligo-
c poly-saccharide or I substrate) convertible to 1,3-pd.

1,3-pd is a starting material for polyesters, polyurethanes and
c cyclic compounds. 1,3-pd can now be produced by a single
recombinant organism from inexpensive carbon sources such
as glucose (rather than costly glycerol or dihydroxyacetone),
c applily and without causing pollution.

Disclosure: Fig 11A-11B: 99pp; English.

The gene encoding this protein (EC-1.1.3.13) is used (in combination with its regulatory sequences and/or those of dihydroxyacetone-synthetase) to produce genetically engineered microorganisms that produce oxidases or other enzymes in yields that allow industrial application on a large scale. The engineered yeasts can produce oxidases having improved properties with respect to their application in oxidation reactions and/or in bleaching and

                                                                                                                                                                                                                                                                                             The present sequence represents the mature glutenin protein. The DNA sequence encoding this protein is isolated from the genomic DNA of Triticum durum L. The gene codes for a low-molecular-weight glutenin protein and can be used to produce transgenic durum wheat plants with "better quality characteristics" [no details given]

HER4 polynucleotides, opt. labelled, are useful in assays (e.g. of HER4 mRNA to detect certain neoplasms, esp. breast carcinoma) and as primers in PCR or as probes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                               US-09-214-478-2
